### **New Polyurethane Discharge Hose and Ratchet Style Retaining Straps For Scag Truck Loaders**

In order to accommodate requests from the field, Truck Loaders are now being shipped with a polyurethane discharge hose in place of the corrugated metal tube that was used in the past.

In addition to changing the hose material, we are also transitioning to a ratchet type retaining strap for use in securing the poly hose to the machine in place of the cast "double bolt" style clamp used with the previous metal discharge tube. See Page 2.

As with the polyurethane discharge hose, the new ratchet strap(s) will also be used to secure the debris intake hose to the truck loader and intake nozzle.

Please note that this shift to the ratchet style retaining straps is a running change. During this transition you may receive product with the new poly discharge hose and the cast double bolt style clamp for the discharge hose along with "bridge type" hose clamps for the intake hose to truck loader and intake nozzle connection points.
